DETAILED ACTION

Response to Amendment

 This Office action is in response to the Amendment filed 01/21/2009. Claim 2 has been cancelled. Claims 1 and 3-9 are now pending.

Allowable Subject Matter

- Claims 1 and 3-9 are allowed.
- The following is a statement of reasons for the indication of allowable subject matter:
 The present claims are allowed over the closet references: Leinweber et al. (US2005/0203193)
 and Podubrin et al. (US 6310106).

Leinweber et al. discloses use of polymers (which is star or branched polymer) in quantities ranging from 0.0001 to 5 % by weight with regard to the oil as demulsifiers for oil-inwater emulsions, wherein the polymers that can be obtained by: alkoxylating an ester obtained with a C2 to C4 alkylene oxide so that the average degree of alkoxylation per OH group ranges from 1 to 100. The polymers have an average molecular weight ranging from 500 to 100,000 g/mol (abstract). The starting material derived from glycerol has multiple epoxide groups. The epoxide ring opening may be carried out with or without catalyst (to form hydroxyl groups). Leinweber et al. also disclose alkoxylation by using ethylene and propylene oxides ([0048] – [0052]). However, Leinweber et al. fail to teach or fairly suggest the claimed method for demulsifying an oil/water emulsion said method comprising adding an alkolylated dendrimer to say oil/water emulsion in an amount from 0.0001 to 5% by weight. based on the oil content of the emulsion to be demulsified said alkolylated dendrimer being a dendritic polyester having a molecular weight of from 2400 to 100 000 g/mol, the molecular weight determined by GPC

Application/Control Number: 10/562,097

Art Unit: 1796

using polyethylene as standard, said <u>dendritic polyester</u> being alkoxylated with C₂-C₄-alkylene oxide groups or a mixture of C₂-C₄-alkylene oxide groups to provide the alkoxylated dendrimer with an average degree of alkoxylation of from 1 to 100 alkylene oxide units per free OH group, wherein the <u>dendritic polyester</u> has a <u>starting alcohol</u> and a dendritic growth component, say the <u>starting alcohol</u> is <u>selected from the group consisting of a mono-alcohol, di-alcohol and polyfunctional alcohol, and the dendritic growth component is a carboxylic acid which has at <u>least two hydroxyl groups</u>. In <u>particular</u>, the starting alcohol is selected from the group consisting of a mono-alcohol, di-alcohol and polyfunctional alcohol, and the dendritic growth component is a carboxylic acid which has at least two hydroxyl groups.</u>

Podubrin et al. disclose a process for breaking an crude oil emulsion by providing an alkoxylated branched carboxylic acid ester derived by the addition of ethylene oxide and/or propylene oxide onto a ring opened epoxidized carboxylic acid triglyceride which is ring opened with a carboxylic acid; and contacting the emulsion with an amount of the alkoxylated carboxylic acid ester. However, Podubrin et al. fail to teach or fairly suggest the method of claim 1, in particular, alkolylated dendrimer being a dendritic polyester having a molecular weight of from 2400 to 100 000 g/mol, the starting alcohol is selected from the group consisting of a mono-alcohol, di-alcohol and polyfunctional alcohol, and the dendritic growth component is a carboxylic acid which has at least two hydroxyl groups.

There is no prior art of record, alone or in combination teach or fairly suggest the claimed method.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance"
